

Vijnova Labs

1. *Design in a way that “Product” is visible after “Problem” intro followed by in depth company description*
2. *Design in an intuitive way - avoid text walls - keep it informative yet navigable*
3. *Add privacy section (indispensable for institutions) - based on platform (asap)*
4. *Add pricing, founder bios, FAQs (later)*

Main Section

Headline

The future belongs not to organisations with the most AI, but to organisations that best combine human judgment with machine intelligence.

Subheading

Vijnova Labs is an organisational intelligence research and software company that designs evidence-based AI systems for knowledge work.

By combining research in psychology, organisational design, and artificial intelligence, we build products that improve decision-making, coordination, information flow, and continuous learning.

What is Organisational Intelligence?

Every organisation exists to solve problems. Whether it is a school guiding students, a hospital treating patients, a law firm advising clients, or an investment firm allocating capital, success depends on how effectively people and technology work together.

At Vijnova Labs, we define Organisational Intelligence as an organisation's collective capacity to perceive information, make decisions, coordinate action, learn from feedback, and continuously adapt to changing environments.

For decades, organisations have improved these capabilities through better management practices and digital technologies. Today, artificial intelligence offers another leap forward, but only when it is deployed thoughtfully.

Our goal is to help organisations build workflows where human expertise and machine intelligence complement one another, allowing professionals to work more effectively without replacing the judgment, accountability, and empathy that only humans can provide.

The Problem

Artificial intelligence has become widely accessible, yet meaningful adoption remains difficult.

Many organisations invest in multiple AI tools expecting dramatic improvements, only to discover fragmented workflows, duplicated effort, inconsistent outputs, and growing complexity. Rather than simplifying work, AI often introduces new systems that employees must learn, manage, and reconcile with existing processes.

The problem is rarely the quality of the underlying AI models. It is that most solutions are designed around technological capabilities rather than the realities of human work.

Knowledge workers do not need another generic AI assistant. They need tools that understand how they make decisions, collaborate with colleagues, interpret information, and serve clients.

Without this understanding, organisations risk paying for disconnected software, creating inconsistent workflows, reducing trust in AI-generated outputs, and leaving much of AI's potential unrealised.

Our Philosophy

At Vijnova Labs, we begin with a different question.

Instead of asking "Where can AI be added?" we ask "How does this work actually happen?"

Every profession relies on a sequence of decisions, information exchanges, judgments, and interactions that have evolved over years of practice. Before introducing automation, we study these workflows to understand where professionals spend time, where bottlenecks emerge, and where human expertise creates the greatest value.

Only then do we determine how artificial intelligence can reduce repetitive effort, surface relevant information, structure knowledge, and accelerate routine tasks while keeping meaningful decisions in human hands.

We do not believe AI should replace professionals.

We believe AI should remove unnecessary cognitive work so professionals can focus on judgment, creativity, empathy, and strategic thinking.

Our Methodology

We Study Work Before We Build Software

Every profession has evolved its own methods of solving problems. Whether a career counsellor guiding a student, a lawyer preparing a case, or a physician diagnosing a patient, effective work is built upon experience, judgment, and structured decision-making.

Rather than beginning with technology, we begin with understanding the work itself.

Our research process combines principles from psychology, organisational design, human-computer interaction, and artificial intelligence to identify where technology can meaningfully improve professional workflows.

Only after understanding how experts think, decide, and collaborate do we design software that supports those processes.

Our Process

1. Workflow Research

We interview professionals, observe their workflows, and understand how information moves through their daily work.

2. Cognitive Mapping

We identify the decisions professionals make, the information they require, the uncertainties they face, and the repetitive tasks that consume their attention.

3. AI Opportunity Analysis

We evaluate where artificial intelligence can reduce cognitive effort without compromising professional judgment or accountability.

4. Platform Design

Rather than building isolated tools, we develop integrated platforms that bring together workflows, information, and AI into a unified experience.

5. Human Validation

AI assists throughout the workflow, but professionals remain responsible for reviewing, refining, and approving important decisions.

6. Continuous Learning

Every product evolves through user feedback, scientific research, and improvements in AI capabilities to remain useful as industries change.

Why Vijnova?

1. Built on Research. Designed for Professionals.

Most AI products optimise models, We optimise workflows.

Our products are built around the belief that meaningful productivity gains come not from replacing people, but from helping them make better decisions with less effort.

2. Evidence-Based Design

Our products draw upon established research in psychology, organisational behaviour, and organisational design rather than intuition alone.

3. Workflow-First Development

Every feature is designed to support how professionals actually work, not how software assumes they should work.

4. Human-Centred AI

Artificial intelligence augments expertise rather than replacing it, ensuring professionals remain responsible for interpretation, judgment, and final decisions.

5. Industry-Specific Solutions

Every profession has unique requirements. Instead of creating generic AI assistants, we build solutions tailored to the workflows of specific industries.

6. Modular Platforms

Our systems are designed to evolve with organisations, allowing new capabilities to be integrated without disrupting existing workflows.

7. Continuous Improvement

We treat every deployment as an opportunity to learn. User feedback, behavioural data, and scientific advances continually inform future development.

Our Products

Evidence-Based Software for Knowledge Workers

Our products are designed around a common principle:

Understand professional workflows first.

Then build AI that supports them.

Our first platform focuses on career counselling, with future products expanding this methodology to other knowledge-intensive professions.

Product One

Margastra

Margastra is an integrated platform that helps career counsellors deliver more structured, evidence-based, and personalised guidance while preserving professional judgment throughout the counselling process.

Instead of relying on disconnected software and manual documentation, Margastra combines psychometric assessment, structured interviews, occupational intelligence, and AI-assisted reporting into a single workflow.

Key Features

1. Psychometric Assessment

Administer scientifically validated assessments and generate structured psychological profiles as the foundation of career guidance.

2. AI-Assisted Interviews

Generate interview guides informed by psychometric results.

During counselling sessions, conversations can be transcribed and analysed using natural language processing to identify themes, strengths, concerns, aspirations, and other relevant insights that supplement the counsellor's own observations.

3. Evidence-Based Report Generation

Large Language Models integrate psychometric findings with interview insights to draft comprehensive career reports.

Counsellors review, edit, and approve every report before it is shared, ensuring that AI supports professional expertise rather than replacing it.

4. Occupational Intelligence Database

Explore thousands of occupations across numerous industries through a structured database containing roles, required competencies, skills, educational pathways, and career progression information.

5. Rule-Based Career Matching

Match individual psychological profiles, interests, strengths, and competencies with suitable occupations using transparent rule-based recommendations grounded in established criteria.

6. Career Roadmapping

Support counsellors in developing personalised long-term career plans that can eventually incorporate educational programmes, certifications, projects, internships, milestones, and skill development pathways.

Future versions will enable ongoing progress tracking and intelligent recommendations to help individuals navigate their career journeys over time.

Technology

Human Intelligence. Machine Intelligence. Working Together.

Our platforms combine multiple AI technologies, each designed to solve a specific problem within professional workflows.

Rather than relying on a single model, we integrate complementary technologies into coherent systems.

These include:

- Natural Language Processing for interview transcription and structured insight extraction.
- Large Language Models for drafting reports and summarising complex information.
- Knowledge and skill graphs to organise occupational intelligence.
- Rule-based recommendation systems for transparent career matching.
- Human-in-the-loop review mechanisms to ensure professional oversight at every critical stage.

Technology is never the objective.

Better work is.

Research

Research Drives Everything We Build

Technology changes quickly. Human work evolves more gradually.

At Vijnova Labs, we believe lasting software cannot be built by following technological trends alone. It must be grounded in an understanding of how people think, make decisions, collaborate, and learn within organisations.

Research is therefore not a supporting activity, it is the foundation of our product development.

We continuously study professional workflows, organisational behaviour, cognitive processes, and advances in artificial intelligence to understand how human expertise and machine intelligence can be integrated more effectively.

This research informs every stage of product development, from identifying problems worth solving to evaluating whether our solutions genuinely improve outcomes for professionals.

Our Research Areas

Our work draws upon multiple disciplines, including:

- Industrial and Organisational Psychology
- Cognitive Science
- Human–Computer Interaction
- Organisational Design
- Behavioural Science
- Artificial Intelligence
- Knowledge Representation
- Decision Science

By combining insights across these fields, we aim to build software that is not only technically capable, but also psychologically informed and organisationally effective.

Sharing What We Learn

We believe research should contribute to the broader professional community.

As Vijnova grows, we intend to publish white papers, technical reports, benchmark studies, and practical insights from our research and product development.

Where appropriate, we also hope to contribute tools, datasets, and methodologies that advance the understanding of organisational intelligence.

Our Vision

Building the Next Generation of Intelligent Organisations

Every major transformation in the history of organisations has changed how people work together.

Scientific management transformed industrial production by bringing structure to physical work.

Modern management consulting helped organisations coordinate increasingly complex businesses.

Artificial intelligence now presents another transformation, but its success will depend not on the technology itself, but on how effectively organisations integrate it into human work.

We believe the future belongs not to organisations that deploy the most AI, but to those that combine human judgment with machine intelligence in ways that are adaptive, trustworthy, and deeply aligned with how professionals actually work.

Our long-term ambition is to help define this new generation of organisations.

Over time, we aim to expand our research and products beyond career counselling into law, healthcare, finance, accounting, wealth management, cybersecurity, public administration, and other knowledge-intensive professions.

Each product will apply the same underlying philosophy: understand human work first, then design AI that strengthens it.

Mission

Our Mission

To transform advances in artificial intelligence into evidence-based, domain-specific software that helps knowledge workers and organisations make better decisions, collaborate more effectively, and continuously improve.

We believe AI creates the greatest value not when it replaces expertise, but when it enables professionals to focus more of their time on judgment, creativity, and meaningful human interaction.

Values

The Principles That Guide Our Work

1. Evidence Before Assumption

Every product should be informed by research, observation, and measurable outcomes rather than intuition alone.

2. Human Agency Before Automation

Technology should expand human capability, not diminish professional responsibility or judgment.

3. Continuous Learning

Every deployment provides an opportunity to learn. User feedback, scientific research, and technological advances continually improve our products.

4. Systems Thinking

Individual tasks exist within larger organisational systems. We design solutions that improve workflows rather than isolated activities.

5. Modularity and Resilience

Organisations evolve over time. Our products are designed to adapt alongside changing technologies, industries, and user needs without requiring organisations to rebuild from scratch.

6. Trust Through Transparency

Professionals should understand how recommendations are generated and retain meaningful oversight over important decisions.

About Vijnova

Why We Started

Artificial intelligence has inspired extraordinary optimism, widespread anxiety, and, in many organisations, growing indifference.

Despite rapid advances in AI capabilities, many professionals still struggle to find tools that genuinely improve the way they work. They are often asked to adapt their workflows to technology rather than using technology that adapts to them.

We founded Vijnova Labs because we believe this approach is fundamentally backwards.

The greatest opportunity is not simply building more capable AI models. It is understanding how professionals think, decide, collaborate, and solve problems; and then designing software that integrates AI into those workflows in ways that are practical, trustworthy, and genuinely useful.

Our goal is to help organisations realise the promise of artificial intelligence through products grounded in research, informed by real-world practice, and refined through continuous learning.

Looking Ahead

From Individual Workflows to Organisational Intelligence

Our first products focus on individual knowledge workers and the professions built around them. As we continue to study how people work, we aim to expand this research across industries and organisational functions.

Our long-term vision is to build an integrated ecosystem of products that improve how organisations make decisions, coordinate work, manage knowledge, and learn from experience.

Each new platform contributes to a broader understanding of organisational intelligence, allowing insights from one domain to inform solutions in another while respecting the unique requirements of every profession.

Whether supporting career counsellors today or healthcare providers, lawyers, financial advisors, and public institutions tomorrow, our objective remains the same:

Design software that helps humans and AI work better together.

Partner With Us

Building the Future of Work Together

Meaningful innovation begins with understanding real problems.

If you're a knowledge worker, organisation, researcher, or institution interested in improving professional workflows through evidence-based AI, we'd like to hear from you.

Whether you're exploring a specific challenge, looking to deploy one of our products, or interested in collaborating on research, we welcome the opportunity to work together.

Primary Call to Action

Book a Demo

Experience how workflow-first AI can improve professional decision-making.

Secondary Call to Action

Schedule a Discovery Call

Let's understand your workflow before proposing a solution.

Research & Partnerships

Interested in research collaborations, pilot programmes, or institutional partnerships?

Closing Statement

Technology alone has never transformed organisations. Better ways of working have.

Every major advance, from scientific management to modern computing, has succeeded because it reshaped how people solve problems together.

Artificial intelligence is no different.

The organisations that thrive in the coming decades will not simply deploy more AI. They will learn to integrate human judgment and machine intelligence into workflows that are more adaptive, more trustworthy, and more effective than either could achieve alone.

That is the future Vijnova Labs is building.
