

Vijnova Labs — Website Blueprint (Revised)

Reordered, trimmed, and de-duplicated for the customer-facing site

Editorial note: this draft cuts repeated statements of your core thesis down to one strong instance per idea, moves the product earlier in the page flow, softens claims not yet backed by evidence, and removes a stray line that had leaked into the original document. Bracketed placeholders mark spots where you should drop in a real number, quote, or detail once available — do not publish with the brackets still in place.

1. Main Section

Headline

The future belongs not to organisations with the most AI, but to organisations that best combine human judgment with machine intelligence.

Subheading

Vijnova Labs builds evidence-based AI software for knowledge work. We study how professionals actually make decisions, then design tools that support that process — starting with career counselling.

Primary CTA

- Book a Demo

Secondary CTA

- See How Margastra Works

Change from original: "Explore Our Research" removed as a homepage CTA — there's no published research to send visitors to yet. Replace it with a link to real content (a product walkthrough, demo video, or one-pager) and reintroduce a research CTA once you have something to show.

2. The Problem

Artificial intelligence has become widely accessible, yet meaningful adoption remains difficult. Many organisations invest in multiple AI tools expecting dramatic improvements, only to end up with fragmented workflows, duplicated effort, and inconsistent outputs.

The issue is rarely the quality of the underlying AI models. It's that most tools are designed around what the technology can do, not around how the work actually gets done.

Knowledge workers don't need another generic AI assistant. They need tools that understand how they make decisions, collaborate with colleagues, and serve their clients.

3. Our Product

Change from original: Product moved from position 6 to position 3. A prospective buyer (a career counsellor, school, or firm) should reach the product within one or two scrolls, not after four sections of philosophy.

Margastra

Margastra is an integrated platform that helps career counsellors deliver more structured, evidence-based, and personalised guidance — while keeping professional judgment at the centre of every decision.

Instead of disconnected software and manual documentation, Margastra brings psychometric assessment, structured interviews, occupational data, and AI-assisted reporting into one workflow.

Key Features

1. Psychometric Assessment

Administer validated assessments and generate structured psychological profiles as the foundation of career guidance.

2. AI-Assisted Interviews

Generate interview guides informed by psychometric results. Session transcripts can be analysed to surface themes, strengths, concerns, and aspirations that supplement the counsellor's own observations.

3. Evidence-Based Report Generation

An LLM integrates psychometric findings with interview insights to draft a career report. The counsellor reviews, edits, and approves every report before it's shared — nothing goes to a client unreviewed.

4. Occupational Intelligence Database

A structured database of roles, competencies, skills, educational pathways, and progression routes across industries.

5. Rule-Based Career Matching

Match a person's psychological profile, interests, and competencies to suitable occupations using transparent, rule-based logic — not a black-box recommendation.

6. Career Roadmapping

Build long-term career plans incorporating education, certifications, and milestones. Progress tracking is planned for a future release.

Change from original: feature descriptions tightened to one sentence of what it does + why the professional should trust it, rather than restating the "human stays in control" theme in nearly every paragraph.

4. Proof It Works

This section does not exist in the original draft. Its absence is the single biggest credibility gap on the page: a company whose entire pitch is "evidence over intuition" currently shows no evidence. Fill this in before launch, even with a single data

point — a pilot result, a time-saved figure, or a counsellor's own words carry more weight than another paragraph of philosophy.

[Add one of the following, in order of strength if available:]

- A specific outcome from a pilot or early user — e.g. "Counsellors using Margastra cut report-writing time from [X hours] to [Y hours] per student."
- A short, attributed quote from a counsellor, school administrator, or advisor who has used the product.
- A concrete before/after workflow comparison (a short visual works well here — a two-column diagram is easy to build).
- If none of the above exist yet: a clearly-labelled "early access" or "currently piloting with [N] institutions" line is more credible than silence, and buys you time until real results land.

5. How We Build

Change from original: "Our Philosophy" and "Our Methodology" have been merged into one section. Both made the same argument (understand the work before automating it) — saying it once, well, lands harder than saying it twice.

Every organisation exists to solve problems — a school guiding students, a hospital treating patients, a firm advising clients. Success depends on how well people and technology work together.

Instead of asking "where can AI be added?", we start by studying how the work already happens: where professionals spend their time, where bottlenecks form, and where their judgment is doing something a model can't replicate. Only then do we decide what to automate.

Our Process

- 1. Workflow Research** — Interview professionals and observe how information moves through their daily work.
- 2. Cognitive Mapping** — Identify the decisions they make, the information they need, and the repetitive tasks consuming their attention.
- 3. AI Opportunity Analysis** — Evaluate where AI can reduce effort without compromising judgment or accountability.
- 4. Platform Design** — Build an integrated workflow, not an isolated tool.
- 5. Human Validation** — Professionals review, refine, and approve every AI-assisted output.
- 6. Continuous Learning** — Every deployment feeds back into the product through user feedback and new research.

Suggestion: this six-step process is a strong candidate for a simple visual (a horizontal flow diagram) rather than a numbered list — it's exactly the kind of structured sequence that's easier to scan as a graphic.

6. Technology

Our platforms combine several AI technologies, each solving a specific problem within a professional's workflow, rather than relying on a single model to do everything:

- Natural Language Processing — interview transcription and structured insight extraction
 - Large Language Models — drafting reports and summarising complex information
 - Knowledge and skill graphs — organising occupational intelligence
 - Rule-based recommendation systems — transparent, explainable career matching
 - Human-in-the-loop review — professional oversight at every critical step
-

7. Why Vijnova

Change from original: cut from 7 points to 4. The original's #1, #3, and #4 ("we optimise workflows," "workflow-first development," "human-centred AI") were the same claim restated three times; consolidated into one entry below.

1. Workflow-First, Not Model-First

We design around how professionals actually work, not around what a model can technically do. Meaningful productivity gains come from removing unnecessary effort, not from adding another assistant.

2. Evidence-Based Design

Our products draw on established research in psychology and organisational behaviour, not intuition.

3. Industry-Specific, Not Generic

Every profession has different requirements. We build for specific workflows rather than a one-size-fits-all assistant.

4. Modular by Design

New capabilities can be added as an organisation's needs change, without rebuilding the platform.

8. Research

Our work draws on multiple disciplines: industrial and organisational psychology, cognitive science, human-computer interaction, organisational design, behavioural science, artificial intelligence, knowledge representation, and decision science.

As Vijnova grows, we intend to publish white papers, technical reports, and practical insights from our product development.

Change from original: shortened significantly. This section previously repeated "research drives everything we build" as a standalone claim already made twice earlier in the page. Kept factual: what disciplines you draw on, and a modest (not yet-tense) statement about future publishing — matched to the fact that nothing is published yet.

9. About, Mission & Values

Change from original: About, Vision, Mission, and Values were four separate sections making largely overlapping points, positioned in the middle of the page. Consolidated into one section and moved toward the end — this content matters more to investors, partners, and job candidates than to a first-time buyer deciding whether to book a demo.

Why We Started

Many professionals still struggle to find AI tools that genuinely improve how they work — they're often asked to adapt their workflow to the technology, rather than the other way around. We started Vijnova Labs to build software the other way: understand how professionals think and decide, then design AI that fits into that process.

Mission

To turn advances in AI into evidence-based, domain-specific software that helps knowledge workers make better decisions and work more effectively — without replacing the judgment, accountability, and empathy only they can provide.

Values

- 1. Evidence Before Assumption** — Every product should be informed by research and measurable outcomes, not intuition alone.
- 2. Human Agency Before Automation** — Technology should expand what professionals can do, not diminish their responsibility or judgment.
- 3. Systems Thinking** — We design for the workflow an individual task sits inside, not the task in isolation.
- 4. Trust Through Transparency** — Professionals should understand how a recommendation was generated and retain real oversight over important decisions.

Change from original: 6 values trimmed to 4 — "Continuous Learning" and "Modularity and Resilience" are already covered in the Process and Why Vijnova sections above, so repeating them here added length without adding a new idea.

Looking Ahead

Margastra is our first product, focused on career counselling. As we learn more about how professionals in other fields work, we plan to bring the same approach to other knowledge-intensive professions.

Change from original: cut the extended comparison to "scientific management" and the framing of Vijnova as defining "the next generation of intelligent organisations." That register fits an investor deck; on a homepage, for a company with one live product, it risks reading as overpromising relative to what's actually built. Kept the forward-looking point, dropped the scale of the claim.

10. Data & Privacy

This section does not exist in the original draft. Margastra handles psychometric assessment results and interview transcripts — sensitive personal data. Institutional buyers (schools, firms) will often ask about this before a demo is even booked, so a short, honest statement here removes friction rather than leaving it to be asked.

[Add 2-3 sentences on: how assessment and interview data is stored and secured, who can access it, whether data is used to train models beyond the individual's own report, and any relevant compliance standard you meet (e.g. GDPR, FERPA, SOC 2) — only claim what is actually true today.]

11. Partner With Us

If you're a knowledge worker, organisation, or researcher interested in improving professional workflows through evidence-based AI, we'd like to hear from you.

Primary CTA

- [Book a Demo](#) — Experience how workflow-first AI can improve professional decision-making.

Secondary CTA

- [Schedule a Discovery Call](#) — Let's understand your workflow before proposing a solution.

Research & Partnerships

Interested in research collaborations, pilot programmes, or institutional partnerships? Get in touch.

12. Footer

Vijnova Labs — Designing the next generation of organisational intelligence.

Navigation

- [Cookie Policy](#)

Change from original: nav updated to reflect the reordered page (Product promoted; "Methodology" renamed "How We Build" to match the merged section).

13. Closing Statement

Technology alone has never transformed organisations. Better ways of working have.

The organisations that thrive won't simply deploy the most AI. They'll learn to integrate human judgment and machine intelligence into workflows that are more adaptive, more trustworthy, and more effective than either could achieve alone.

That's the future Vijnova Labs is building.

Change from original: shortened. The closing statement previously repeated the exact headline claim and the scientific-management comparison already used elsewhere on the page — trimmed to the two sentences that add something the reader hasn't already read twice.

Summary of Changes

For quick reference, here's what changed and why:

- Removed a stray editorial line that had been left in the original document by mistake.
- Cut the core thesis ("study the work before building the AI") from roughly eight restatements down to two: once in How We Build, once implicitly in Why Vijnova.
- Moved the Product section from position six to position three, so a first-time visitor reaches it quickly.
- Merged Philosophy and Methodology into one section (How We Build).
- Merged About, Vision, Mission, and Values into one consolidated section, moved toward the bottom of the page.
- Trimmed Why Vijnova from 7 points to 4, and Values from 6 to 4, removing points that restated ideas covered elsewhere.
- Softened language that presented Vijnova's ambitions as historically inevitable (e.g. comparisons to scientific management, "defining the next generation of organisations") to match the fact that there is currently one product in market.
- Replaced the "Explore Our Research" homepage CTA, since there is no published research yet to send visitors to.
- Added a Proof It Works section — currently a placeholder, but flagged as the single highest-priority gap: a company whose brand is "evidence-based" should show evidence.
- Added a Data & Privacy section, since the product handles sensitive psychometric and interview data and institutional buyers will expect to see this addressed.
